Reflection

AI has been helpful to me because sometimes it takes a long time to read code, understand it, or go through an assignment. I will sometimes ask AI to explain assignments that are either too long or too complicated, give me steps to complete them with explanations so I would not get confused, or a draft so I could go in and do the work I need to do. If I feel like AI is doing work that I can no longer understand, I make sure to ask it to explain what it did so I am not lost in my course. I am not too good at coding so AI has been very helpful.

I have also asked AI to help me study for math tests. However, it sometimes gets a formula or answer wrong which confuses me and leads me in the wrong direction. Because I was led in the wrong direction every step or problem with that step that I get ends up being wrong. Because of this I no longer rely on AI as much for math help.

Moving forward, I plan to use AI as a guide to help me work through problems rather than just giving me the answers. I feel like this approach will help me learn more, improve my performance in my courses, and prepare me for my professional life. It will keep my life easier but I will also learn.
